

ProgressGraph

Deterministic game progress tracking without a framework

Overview

ProgressGraph is a lightweight runtime toolkit for tracking, validating, and persisting game progress using named flags and explicit dependency rules.

Core Concepts

Progress Flags represent discrete pieces of game state such as `Boss.Defeated` or `Door.Opened`.

Dependencies define explicit progression requirements between flags.

Public API

Define flags, declare dependencies, query state, and export/import snapshots with a clean C# API.

Save & Load

ProgressGraph exposes a snapshot model that integrates with any save system.

What This Asset Is Not
